PRIORITY APPLN. INFO.: US 2003-511250P P 20031014

AB Methods for identifying mols. that selectively interact with quadruplex motifs in nucleic acids, such as G tetrads, are described. These structures may play a role in the regulation of gene expression and so are potential drug targets. Methods are based on the ability of the compound to modify the structure to allow DNA polymerase readthrough in primer extension assays. DNA polymerases are typically stalled by these motifs. An IC50 for a test compound is a concentration which produces equal nos. of full-length and stalled primer extension products.

IT 850245-43-1

RL: ARU (Analytical role, unclassified); CAT (Catalyst use); ANST (Analytical study); USES (Uses) (as effector of DNA quadruplex formation; competition assay for identifying small mols. modulating formation of quadruplex nucleic acid structures)

AB The present invention relates to quinobenzoxazines analogs I [V = H, halo, NR1R2; A = H, F, N(R1)2; Z = O, S, NR1, CH2; U = OR2, NR1R2; X = OR2, NR1R2, halo, azido, SR2; R1 and R2 in NR1R2 may form a double bond or ring; R1 = H, alkyl; R2 = H, alkyl or alkenyl optionally containing one or more non-adjacent heteroatoms selected from N, O, and S, and optionally substituted with a carbocyclic or heterocyclic ring; or R2 = (un)substituted heterocyclyl, (hetero)aryl; W = (un)substituted 1,2-benzo, pyrido, naphthaleno, etc., and pharmaceutically acceptable salts, esters and prodrugs thereof] which are useful for ameliorating a cell disorder such as cancer. Forty-six synthetic examples showed the synthesis of intermediates. E.g., a 4-step synthesis of the fluoroacid II, starting from potassium Et malonate and 2,3,4,5-tetrafluorobenzoyl chloride, was given. Such prepared fluoroacids were reacted with amines to provide compds. I which were then tested in MTS assay and for inhibition of c-myc mRNA. E.g., the compound III showed 50% inhibition of c-myc mRNA levels at 4 μ M. The compds. I were tested for antitumor activity in mice (biol. data given for representative compds. I). The compds. I were also claimed as useful for ameliorating a microbial infection.

IT 783361-59-1P

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The present invention relates to quinobenzoxazine analogs I [V = H, halo, NR1R2; A = H, F, N(R1)2; Z = O, S, NR1, CH2; U = OR2, NR1R2; X = OR2, NR1R2, halo, azido, SR2; R1 and R2 in NR1R2 may form a double bond or ring; R1 = H, alkyl; R2 = H, alkyl or alkenyl optionally containing one or more non-adjacent heteroatoms selected from N, O, and S, and optionally substituted with a carbocyclic or heterocyclic ring; or R2 = (un)substituted heterocyclyl, (hetero)aryl; W = (un)substituted 1,2-benzo, pyrido, naphthaleno, etc.; and pharmaceutically acceptable salts, esters and prodrugs thereof] which are useful for ameliorating a cell disorder such as cancer. Forty-six synthetic examples showed the synthesis of intermediates. E.g., a 4-step synthesis of the fluoroacid II, starting from potassium Et malonate and 2,3,4,5-tetrafluorobenzoyl chloride, was given. Such prepared fluoroacids were reacted with amines to provide compds. I which were then tested in MTS assay and for inhibition of c-myc mRNA. E.g., the compound III showed 50% inhibition of c-myc mRNA levels at 4 µM. The compds. I were tested for antitumor activity in mice (biol. data given for representative compds. I). The compds. I were also claimed as useful for ameliorating a microbial infection.

AB Retroviral integrases catalyze two of the steps of insertion of proviral DNA into the host genomic DNA. Inhibitors that target the second step, strand transfer into the host DNA, have been demonstrated to have antiviral activity in cell culture. The authors describe two classes of HIV-1 integrase inhibitors that block strand transfer, one based on a naphthamide core and one on a benzimidazole core. While the naphthamide compds. showed some propensity to interact with the DNA substrate, both classes were shown to bind directly to integrase. The naphthamide compds. showed activity in cell culture, and a direct effect on integrase was indicated by an increase in 2-LTR products in the presence of a naphthamide compound. These two classes of compds. represent potential starting points for the development of new classes of integrase inhibitors.

 these compds. with duplex DNA, we have designed and synthesized novel hybrid DNA-interactive compds. that alkylate DNA most efficiently at sequences directed by topoisomerase II. The epoxydihydrofuran ring of psorospermin was used as a DNA alkylating moiety, and this was fused to the pyridobenzophenoxazine ring of A-62176, giving for example hybrid epoxide-3 I. The chlorohydrin ring opened form of the epoxide, II, was also prepd. and tested. II was prepd. by reacting the N-BOC protected mesylate with 18-crown-6/K₂CO₃/acetone to form the epoxide which was treated with aq. HCl/EtOAc to remove the BOC group and form the chlorohydrin. These hybrid compds. showed enhanced DNA alkylating activity in the presence of topoisomerase II, exhibited significant activity against all the cancer cells tested at submicromolar concns., and were more potent than both parent compds. However, the biochem. assays indicated that they lost some of the topoisomerase II and Mg²⁺ dependency for reaction with DNA that is assoc. with psorospermin and A-62176, resp.

AB Topoisomerase II, an enzyme that catalyzes changes in the topol. of DNA, plays several key roles in DNA metabolism and chromosome structure, and it is the primary cytotoxic target for a number of clin. important DNA intercalating agents such as doxorubicin. It seems likely that if these intercalating topoisomerase II poisons are structurally modified to also be DNA alkylating agents, they will have increased dwell time on the topoisomerase II-DNA complex and increased potency and selectivity for cancer cells. On the basis of insights into the mechanisms of action of psorospermin and the quinobenzoxazine A-62176 and mol. modeling studies of

 AB Topoisomerase inhibitors are important and clin. effective drugs, while G-quadruplex-interactive compds. that disrupt telomere maintenance mechanisms have yet to be proven useful in the clinic. If G-quadruplex-interactive compds. are to be clin. useful, it will most likely be in combination with more established cytotoxic agents. A family of topoisomerase II inhibitors that also interact with G-quadruplexes was previously reported. On the basis of previously established structure-activity relationships (SARs) for compds. that are able to inhibit topoisomerase II or interact with G-quadruplexes to varying degrees, four new fluoroquinolone anthraquinones (FQAs) with different profiles of mixed topoisomerase II poisoning effects and G-quadruplex interactions were designed and synthesized. The biol. profiles of the four new compds. were determined with respect to G-quadruplex interaction (polymerase stop and photocleavage assays) and topoisomerase II interaction (DNA cleavage and kDNA decatenation assays), alongside cytotoxicity tests with matched pairs of topoisomerase II-resistant and topoisomerase II-sensitive cells and with telomerase (+) and ALT (+) cell lines (ALT = alternative lengthening of telomeres). From this study, two FQAs with sharply contrasting profiles of potent G-quadruplex interaction with a weak topoisomerase II poisoning effect, and vice versa, were identified for further evaluation to determine the optimum combination of these activities in subsequent in vivo studies.

AB In this study we have identified a new structural motif for a ligand with G-quadruplex interaction that results in biol. effects associated with G-quadruplex-interactive compds. Fluoroquinolones have been reported to possess weak telomerase inhibitory activity in addition to their better known

bacterial gyrase poisoning. Starting with a fluoroquinobenzoxazine, which has modest potency in a human topoisomerase II assay, we have designed a more potent inhibitor of telomerase that has lost its topoisomerase II poisoning activity. This fluoroquinophenoxazine (FQP) interacts with G-quadruplex structures to inhibit the progression of Taq polymerase in a G-quadruplex polymerase stop assay. In addition, we demonstrate by 1H NMR studies that this compound interacts with telomeric G-quadruplex structures by external stacking to the G-tetrad with both the unimol. fold-over and the parallel G-quadruplex structures. A photocleavage assay confirms the FQP interaction site, which is located off center of the external tetrad but within the loop region. Mol. modeling using simulated annealing was performed on the FQP-parallel G-quadruplex complex to determine the optimum

FQP orientation and key mol. interactions with the telomeric G-quadruplex structure. On the basis of the results of these studies, two addnl. FQP analogs were synthesized, which were designed to test the importance of these key interactions. These analogs were evaluated in the Taq polymerase stop assay for G-quadruplex interaction. The data from this study and the biol. evaluation of these three FQPs, using cytotoxicity and a sea urchin embryo system, were in accord with the predicted more potent telomeric G-quadruplex interactions of the initial lead compound and one of the analogs. On the basis of these structural and biol. studies, the design of more potent and selective telomeric G-quadruplex-interactive compds. can be envisaged.

AB The quinobenzoxazines, a group of structural analogs of the antibacterial fluoroquinolones, are topoisomerase II inhibitors that have demonstrated promising anticancer activity in mice. It has been proposed that the quinobenzoxazines form a 2:2 drug-Mg2+ self-assembly complex on DNA. The quinobenzoxazine (S)-A-62176 is photochem. unstable and undergoes a DNA-accelerated photochem. reaction to afford a highly fluorescent photoproduct. Here we report that the irradiation of both supercoiled DNA

and DNA oligonucleotides in the presence of (S)-A-62176 results in photochem. cleavage of the DNA. The (S)-A-62176-mediated DNA photocleavage reaction requires Mg2+. Photochem. cleavage of supercoiled DNA by (S)-A-62176 is much more efficient than the DNA photocleavage reactions of the fluoroquinolones norfloxacin, ciprofloxacin, and enoxacin. The photocleavage of supercoiled DNA by (S)-A-62176 is unaffected by the presence of SOD, catalase, or other reactive oxygen scavengers, but is inhibited by deoxygenation. The photochem. cleavage of supercoiled DNA is also inhibited by 1 mM XI. Photochem. cleavage of DNA oligonucleotides by (S)-A-62176 occurs most extensively at DNA sites bound by drug, as

determined by DNase I footprinting, and especially at certain G and T residues. The nature

of the DNA photoproducts, and inhibition studies, indicate that the photocleavage reaction occurs by a free radical mechanism initiated by abstraction of the 4'- and 1'-hydrogens from the DNA minor groove. These results lend further support for the proposed DNA binding model for the quinobenzoxazine 2:2 drug-Mg2+ complex and serve to define the position of this complex on the minor groove of DNA.

AB The quinobenzoxazine compds., derived from antibacterial quinolones, is active in vitro and in vivo against murine and human tumors. In this contribution, we show that the relative DNA binding affinity of the quinobenzoxazine compds. correlates with their cytotoxicity, their ability to inhibit gyrase-DNA complex formation, and the decatenation of kinetoplast DNA by human topoisomerase II. DNA binding studies with the decarboxy-A-62176 analog indicate that the β -keto acid moiety of the quinobenzoxazine compds. plays an important role in their interaction with DNA.

 AB Determination of the clastogenic potential of new chemical entities, particularly

pharmaceuticals, is an important part of the overall safety assessment of such drugs. It is appreciated that clastogenicity can arise from perturbation of many different cellular processes distinct from direct DNA/drug interactions. One such alternative clastogenic process is inhibition of DNA topoisomerase II, during which process the topoisomerase/DNA/drug ternary complex forms stable DNA double-strand breaks (cleavable complex), which become templates for recombinational, mutagenic, and chromosomal fragmentation events. Without extensive experimentation, it is generally not possible to distinguish clastogenicity arising from direct drug/DNA interaction from that arising from inhibition of topoisomerase II. In the present investigation, we demonstrate that specific catalytic inhibitors of DNA topoisomerase II reduce the clastogenicity of topoisomerase poisons but not that arising via non-topoisomerase-dependent mechanisms. In particular, it is shown that catalytic topoisomerase II inhibitors such as chloroquine, sodium azide, and A-74932, as well as certain intercalating agents such as 9-aminoacridine and ethidium bromide, strongly antagonize the formation of micronuclei induced by the DNA gyrase inhibitor ciprofloxacin and the antitumor topoisomerase II poison etoposide. These catalytic inhibitors are also shown to antagonize the clastogenicity of exptl. compds. and novel pharmaceuticals presumed to be DNA intercalating agents by virtue of their response in a cell-based bleomycin amplification assay. We extend our previous hypothesis, suggesting that the clastogenicity of some nonstructurally alerting drugs may be due to an as yet unappreciated propensity for DNA intercalation. It is further proposed that intercalation-dependent inhibition of DNA topoisomerase II may be responsible for this clastogenicity and that this may be detected in intact mammalian cells with the use of catalytic topoisomerase inhibitors.

 AB The structural impact of covalent and noncovalent interactions of drugs with DNA is an important component for understanding the biochem. and biol. consequences of DNA damage. Work in this laboratory has focused on a number of potentially therapeutically important drugs that distort DNA by unwinding, bending DNA into the major or minor groove. These lead to enhanced recognition of DNA by proteins involved in transcription and replication. In this paper, the authors will present the structures of one of these complexes using the quinobenzoxazine compound A-62176 and show how 31P-NMR can be used to monitor these distortive effects.

L4 ANSWER 15 OF 42 CAPLUS COPYRIGHT 2005 ACS on STN (Continued)

AB The invention discloses a novel quinobenzoxazine self-assembly complex on DNA and on the topoisomerase II-DNA complex. The related model is used to design and synthesize a new series of quinobenzoxazines, pyridobenzophenoxazines, pyridonaphthoxazines, and other related compds. (I) [m, m', n, n'] = independently 0, 1, 2; A = O, S, C; B, C = independently N, O, S, C, CH, CH2; X = H or halo; W = H, NO2, NH2, alkyl amino, haloalkyl, or halo; Z = halo or N-containing C1-6 group; R1 = H or carboxy-protecting group; R2 = H, halo, C1-6 alkyl that may exhibit anticancer or antibiotic activity. Thus, Et 2,3,4,5-tetrafluorobenzoylacetate was loaded on a solid support resin by transesterification and refluxed in toluene in the presence of catalytic amts. of DMAP to form the solid-bound B-ketoester. The ester was treated with DMF di-Me acetal followed by 2-aminophenol in the presence of pyridine to generate the resin-bound enaminoketoester. The product was cyclized and further derivatized in three steps to yield 1-(5)-(3-aminopyrrolidin-1-yl)-2-fluoro-4-oxo-4H-pyrido[3,2,1-k,1]phenoxazine-5-carboxylic acid TFA salt (II.CF3CO2H). The anticancer activity of these compds. is thought to operate via stabilization of the topoisomerase II-DNA complex and/or interaction with G-quadruplexes, while the antibiotic activity of these compds. derives from their ability to inhibit gyrase, the bacterial type II topoisomerase. Decatenation inhibition, DNA unwinding, and cytotoxicity data for selected pyridobenzophenoxazines were given. For example, topoisomerase II inhibition was reported with IC50 values ranging from 0.22 to 1.84 μM.

 AB Quinobenzoxazine A-62176, developed from the anti-bacterial fluoroquinolones, is active in vitro and in vivo against murine and human tumors. It has been previously claimed that A-62176 is a catalytic inhibitor of mammalian topoisomerase II that does not stabilize the cleaved complex. However, at low drug concns. and pH 6-7, we have found that A-62176 can enhance the formation of the cleaved complex at certain sites. Using a photocleavage assay, mismatched sequences, and competition expts. between psorospermin and A-62176, we pinpointed the drug binding site on the DNA base pairs between positions +1 and +2 relative to the cleaved phosphodiester bonds. A 2:2 quinobenzoxazine-Mg2+ self-assembly model was previously proposed, in which one drug mol. intercalates into the DNA helix and the second drug mol. is externally bound, held to the first mol. and DNA by two Mg2+ bridges. The results of competition expts. between psorospermin and A-62176, as well as between psorospermin and A-62176 and norfloxacin, are consistent with this model and provide the first evidence that this 2:2 quinobenzoxazine-Mg2+ complex is assembled in the presence of topoisomerase II. These results also have parallel implications for the mode of binding of the quinolone antibiotics to the bacterial gyrase-DNA complex.

 AB A new class of pyridobenzophenoxazines was developed as topoisomerase II inhibitors for anticancer chemotherapy. These compds. were designed based on a proposed model of a quinobenzoxazine self-assembly complex on DNA. They showed excellent inhibitory effects on several tumor cell lines with nanomolar IC50 values. Their cytotoxic potency correlates with their ability to unwind DNA and inhibit topoisomerase II.

DOCUMENT NUMBER: 129:89796

TITLE: Bis(2,6-dioxopiperazines), catalytic inhibitors of DNA topoisomerase II, as molecular probes, cardioprotectors and antitumor drugs

AUTHOR(S): Andoh, T.

CORPORATE SOURCE: Department of Bioengineering, Faculty of Engineering, Soka University, Tokyo, 192, Japan

SOURCE: Biochimie (1998), 80(3), 235-246

CODEN: BICMBE; ISSN: 0300-9084

PUBLISHER: Editions Scientifiques et Medicales Elsevier

DOCUMENT TYPE: Journal; General Review

LANGUAGE: English

AB A review with 96 refs. Bis(2,6-dioxopiperazines) and other catalytic inhibitors of mammalian DNA topoisomerase II have recently been found in natural and synthetic compds. These compds. target the enzyme within the cell and inhibit various genetic processes involving the enzyme such as DNA replication and chromosome dynamics and thus proved to be good probes for the functional analyses of the enzyme in a variety of eukaryotes from yeast to mammals. Catalytic inhibitors were shown to be antagonists against topoisomerase II poisons under some conditions, but to be synergistic under others. Bis(2,6-dioxopiperazines) have a potential to overcome cardiac toxicity caused by potent antitumor anthracycline antibiotics such as doxorubicin and daunorubicin. ICRF-187, (+)-enantiomer of racemic ICRF-159, has been used in EU countries as cardioprotector in cancer clinics. Furthermore, bis(2,6-dioxopiperazines) enhance the efficacy of antitumor topoisomerase II poisons, e.g., anthracycline antibiotics such as daunorubicin and doxorubicin, by reducing their side effects and by allowing dose escalation of the antitumor drugs in preclin. and clin. settings. Besides bis(2,6-dioxopiperazines) per se having antitumor activity, and one of their derivs., MST-16 or sobuzoxane, bis[N(1-isobutyloxycarbonyloxymethyl)-2,6-dioxopiperazine], has been developed in Japan and used in clinics as anticancer drug for malignant lymphomas and adult T-cell leukemia (ATL). Further developments of bis(2,6-dioxopiperazines) as antimetastatic agents are expected.

TITLE: Evidence for the Formation of 2:2 Drug-Mg²⁺ Dimers in Solution and for the Formation of Dimeric Drug Complexes on DNA from the DNA-Accelerated Photochemical Reaction of Antineoplastic Quinobenzoxazines

AUTHOR(S): Yu, Hongtao; Hurley, Laurence H.; Kerwin, Sean M.

AB The quinobenzoxazines are a group of topoisomerase II catalytic inhibitors that have demonstrated promising anticancer activity in mice. They have been proposed to form an unprecedented 2:2 drug-Mg²⁺ self-assembly complex on DNA. We have exploited the photochem. decomposition of the quinobenzoxazines to gain further support and insights into the nature of 2:2 quinobenzoxazine-Mg²⁺ dimers and the 2:2 drug-Mg²⁺ complex on duplex DNA. The quinobenzoxazine A-62176 undergoes photodecompn. to highly fluorescent products. Me viologen (MV²⁺) accelerates this photoreaction almost 500-fold. The formation of 2:2 drug-Mg²⁺ dimers in solution is deduced from the Mg²⁺-dependent difference in the MV²⁺-facilitated photoreaction rates of racemic and scalemic A-62176. However, both racemic and scalemic A-62176 have identical MV²⁺-facilitated photoreaction rates in the presence of Mg²⁺ and the achiral fluoroquinolone Norfloxacin, due to heterochem. norfloxacin/A-62176 dimer complex formation. DNA also accelerates the photochem. decomposition of A-62176 up to 80-fold. This DNA-acceleration requires Mg²⁺, duplex DNA, mol. oxygen, and intercalation of the drug into the DNA duplex. In the proposed model for drug-DNA complexation, only one drug mol. of each 2:2 drug-Mg²⁺ dimer intercalates into the DNA duplex, the other mol. binds externally to the DNA. Norfloxacin, which can only play the external binding role, was able to modulate the photochem. reaction of the quinobenzoxazines on DNA. Furthermore, it appears that the precise positioning of the intercalated mol., which is modulated by the structure and stereochem. of the externally bound mol., plays an important role in determining the rate of photoreaction on DNA. The implications of the observed photochem. reaction of the quinobenzoxazines are described for human phototoxicity, photodynamic therapy, mechanism of action studies, and improved drug design for both topoisomerase and pyrase inhibitors.

L4 ANSWER 20 OF 42 CAPLUS COPYRIGHT 2005 ACS on STN (Continued)

AB Quinolinobenzoxazine derivs. of the formula I as well as the pharmaceutically acceptable salts, esters, amides and prodrugs thereof are disclosed, wherein R1 is hydrogen or a carboxy-protecting group, R2 and R3 are substituents, A is oxygen, Z is a halogen or a nitrogen-containing group,

X in hydrogen, halogen or alkyl, and W is hydrogen, alkyl, amino or halogen. Antineoplastic activity of title compound II (preparation given) against solid tumors implanted in mice was measured as mean lifespan comparison value, or mean survival time (test/control) [AMST(7/C)]: 215% at 12.5 mg/kg. Pharmaceutical compns. are given.

AB A-84441, a potent new antitumor quinolone, was active in vitro and in vivo against murine and human tumors. A-84441, a prodrug, was comparable in potency to the parent compound with an IC50 range of 0.03-0.49 µg/mL against a panel of murine and human tumor cell lines. The parent compound bound mammalian DNA in a magnesium-dependent manner and caused inhibition of DNA and RNA synthesis. A-84441 produced a significant increased life span and cures in three lines of i.p. implanted murine tumors. A-84441 was active against seven of nine solid tumors including s.c. murine tumors and human tumor xenografts. The compound appeared to be more active when administered i.v. compared to i.p. injection. Antitumor efficacy was little affected by treatment schedule, although multiple divided dosing was generally more effective than single dose treatment. A-84441 was over 10-fold more active against murine leukemic cells than against normal murine bone marrow cells. The acute toxicity of A-84441 following single or multiple dosing ranged between 11 and 50 mg/kg dependent on schedule of administration when given by i.v. or i.p. route. The agent has no apparent toxicity or efficacy when administered p.o.

AB DNA topoisomerases, found in all prokaryotic and eukaryotic cells, play a key role in controlling the topol. state of DNA. They are involved in DNA replication, RNA transcription and recombination affecting cell proliferation. Quinolone antibacterial agents have been shown to be inhibitors of DNA gyrase, a bacterial topoisomerase II enzyme. The eukaryotic topoisomerase II is the target of various cytotoxic agents such as adriamycin and etoposide. Due to the mechanistic similarities and sequence homologies shared by both bacterial and mammalian DNA topoisomerase II, we initiated a screening program to search for quinolones as antitumor agents and reported the identification of a new class of quinolone, quinobenoxazines, having excellent in vitro cytotoxic activity comparable to adriamycin. In the continuation of this research work, we synthesized a series of amino-substituted quinobenoxazines and found that some of them possess more potent in vitro cytotoxicity than the parent unsubstituted quinobenoxazines. The chemical synthesis as well as biol. properties of these tetracyclic quinolones are described.

 AB The quinobenzoxazine compds. A-62176 and A-85226 belong to a novel class of antineoplastic agents that are catalytic inhibitors of topoisomerase II and also structural analogs of the antibacterial DNA gyrase inhibitor Norfloxacin. In vitro studies have shown that their antineoplastic activity is dependent upon the presence of divalent metal ions such as Mg²⁺ and Mn²⁺, although the precise role of these ions in the mechanism of action is unknown. In this study we have investigated the structures of the binary complex between the quinobenzoxazines and Mg²⁺ and the ternary complex between quinobenzoxazine-Mg²⁺ and DNA. The stoichiometry of the binary and ternary complexes and the biophys. studies suggest that a 2:2 drug:Mg²⁺ complex forms a "heterodimer complex" with respect to DNA in which one drug mol. is intercalated into DNA and the second drug mol. is externally bound, held to the first mol. by two Mg²⁺ bridges, which themselves are chelated to phosphates on DNA. There is a cooperativity in binding of the quinobenzoxazines to DNA, and a 4:4 drug:Mg²⁺ complex is proposed in which the two externally bound mols. from two different 2:2 dimers interact via π - π interactions. The externally bound quinobenzoxazine mols. can be replaced by the quinolone antibacterial compound Norfloxacin to form mixed-structure dimers on DNA. Based upon the proposed model for the 2:2 quinobenzoxazine:Mg²⁺ complex on DNA, a parallel model for the antibacterial quinolone-Mg²⁺-DNA gyrase complex is proposed that relies upon the ATP-fueled unwinding of DNA by gyrase downstream of the cleavable complex site. These models, which have analogies to leucine zippers, represent a new paradigm for the structure of drug-DNA complexes. In addition, these models have important implications for the design of new gyrase and topoisomerase II inhibitors, in that optimization for structure-activity relationships should be carried out on two different quinolone mols. rather than a single mol.

AB The antineoplastic quinobenoxazines A-62176 and A-74932 were shown to be potent inhibitors of mammalian DNA topoisomerase II in vivo. This was demonstrated by their selective inhibition of the SV40 DNA replication stages that require topoisomerase II. Neither drug stabilized a covalent complex of the enzyme with SV40 DNA, which suggests that they are not poisons of DNA topoisomerase II. A-77601, an analog having little antitumor activity, barely inhibited DNA topoisomerase II in vivo, even at high concns. These findings were supported by in vitro studies which showed that A-62176 and A-74932, but not A-77601, strongly inhibited the catalytic activity of mammalian DNA topoisomerase II. A-62176 did not cause topoisomerase II-mediated DNA strand breaks in vitro under conditions in which adriamycin produced extensive DNA breakage. The antineoplastic and topoisomerase inhibitory activities of the quinobenoxazines correlate with their ability to unwind DNA. A-62176 antagonized the poisoning of topoisomerase II by VM-26 in vivo and in vitro, but had no effect on DNA breakage induced by camptothecin, a DNA topoisomerase I poison. A-62176 and A-74932 thus inhibit DNA topoisomerase II reactions at a step prior to the formation of the "cleavable complex" intermediate. These findings indicate that stabilization of the DNA topoisomerase II-DNA cleavable complex is not necessary for the antitumor activity of this class of quinolones and that the catalytic inhibition of DNA topoisomerase II may contribute significantly to the anticancer activity of other DNA topoisomerase II inhibitors.

AB Diastereomers of the quinobenzoxazine antineoplastic drug Abbott-8444.1 and minor impurities were determined using high-performance liquid chromatog. Manufacturing impurities, degradation products, and diastereomers were separated using a reversed phase system with gradient elution. Detector response was linear for Abbott-8444.1 to approx. 20 µg/mL which represents 4.0% of the drug concentration. The procedure provides quantitation of impurities to approx.

the 0.1% level with precision (relative standard deviations) of 7.3% to 31%

in typical bulk drug lots. A variety of reversed-phase columns were evaluated for the assay method with the optimum resolution achieved using a 5-µm Alltima C18 packing.

AB The title compds. [I: A = O, CH2, S; R1 = H, carboxy-protecting group; R2 = H, C1-6 alkyl, C1-6 alkoxy, C1-6 sulphydroalkyl; R3 = H, halogen, NO2, C1-6 alkyl, CO2H, methylenedioxy, CN, halo-substituted C1-6 alkyl, hydroxy-substituted C1-6 alkyl, (un)substituted amino, etc.; W = H, C1-6 alkyl, (un)substituted amino, halogen, alkoxy, HO, etc.; X = H, halogen, C1-6 alkyl, halo-substituted C1-6 alkyl; Z = halogen, (un)substituted N-containing heterocyclo, etc.], useful for the treatment of leukemia, melanoma, lung, colon, and ovarian carcinomas, are prepared. Thus, 1-(3-aminopyrrolidin-1-yl)-2-fluoro-4-oxo-4H-quinol[2,3,4-i,j][1,4]benzoxazine-5-carboxylic acid hydrochloride was converted into 1-(3-alanylalanylaminopyrrolidin-1-yl)-2-fluoro-4-oxo-4H-quinol[2,3,4-i,j][1,4]benzoxazine-5-carboxylic acid hydrochloride (II) in 4 steps. II demonstrated 197% mean lifespan comparison value when administered at 20 mg/kg to colon adenocarcinoma-implanted mice, vs. 100% for similarly implanted mice receiving no treatment.

AB Eleven title compds. are prepared as medical virucides. Thus, the piperazinyl derivative I inhibited release of virus-specific DNA from hepatitis B virus-infected hepatoma cells with an IC50 of 0.1 µM. I was prepared by coupling Et 3-ethoxy-2-(2,3,4,5-tetrafluorobenzoyl)acrylate with 2-aminopropionaldehyde di-Me acetal, cyclizing to a quinolin-4-one derivative by heating, acid hydrolysis of the acetal, base-catalyzed formation of a tricyclic compound, and reaction with piperazine.

AB The regioselective synthesis of highly substituted 2-pyridylindoles, e.g. I (R = H, Et), has been accomplished via a three step reaction sequence which involves the unique formation of the synthetically flexible pyridine intermediates II (X = OMe, Y = H, OMe; X = F, Y = H).

AB DNA topoisomerases, found in all prokaryotic and eukaryotic cells, play a key role in controlling the topol. state of DNA. Quinolone antibacterial agents are inhibitors of DNA gyrase, a bacterial topoisomerase II enzyme. The eukaryotic topoisomerase II is the target of various cytotoxic agents such as adriamycin and etoposide. Recently, several quinolones having C-8 fluoro and C-8 chloro substituents were shown to have cytotoxic activities and to interact with mammalian topoisomerase II. In searching for an antitumor agent of the quinolone class, several quinolones having excellent in vitro cytotoxic activity were identified. A-74932 (I) also had good activity in vivo against both systemic tumor and s.c. implanted murine solid tumors as well as human tumor xenografts.

II

AB The title compds. (I; R = piperazino, 4-methylpiperazino) were prepared by reduction of 5,6-difluoro-9-nitro analog with FeSO₄ in an alkaline environment,

and amination with the appropriate heterocyclic base. A suspension of 1.1 g II in a solution of 4 g NaOH in 150 mL H₂O was refluxed 0.5 h, treated by

a solution of 10 g FeSO₄·7H₂O in 50 mL H₂O, and the mixture refluxed 0.5 h to give 0.35 g 9-amino analog I (R = F), which (0.33 g) was stirred 20 h with 0.5 g N-methylpiperazine in pyridine under Ar to give 0.25 g title compound (I; R = 4-methylpiperazino) which in vitro inhibited (activity in parentheses expressed in mg/mL), e.g., Streptococcus pyogenes (1), Staphylococcus aureus (16), Pseudomonas aeruginosa (64), etc.

AB The title compds. [I; R1 = CO2H, MeCO, (Cl-4 alkoxy)carbonyl; R2, R3 = H, halo] were prepared as bactericides (no data) by cyclocondensation of hydroxy(oxo)quinolines II [R4 = MeCO, Cl-4 alkoxy)carbonyl] with 2,4-(NO2)C6H3X (X = Cl, F) in the presence of a base. Thus, a mixt of 2.32 g Et 1,4-dihydro-8-hydroxy-4-oxo-3-carboxylate and 0.33 g of 80% NaH in 20 mL DMF was stirred 1 h at room temperature and treated with 1.9 g 2,4-(O2N)C6H3F in 10 mL DMF. The mixture was stirred 1 h at room temperature and refluxed 4 h to give 0.33 g I (R1 = CO2Et, R2, R3 = H).

AB The synthesis and antibacterial activity of quinobenzoxazine-5-carboxylic acids I (R = piperazinyl, 4-methylpiperazinyl, 3-methylpyrrolidinyl) is described. Key steps in the synthesis include carbon homologation and two intramol. nucleophilic displacement cyclization reactions to generate the 4-oxo-4H-quinol[2,3,4-i,j]-[1,4]benoxazine-5-carboxylic acid nucleus. I showed good broad spectrum antibacterial activity against 5 gram-pos. and 6 gram-neg. bacteria, but they are slightly less potent than their uncyclized arylquinolone analog.

L4 ANSWER 39 OF 42 CAPLUS COPYRIGHT 2005 ACS on STN (Continued)

II

III

AB The title compds. [I; R1-R6 = H, (substituted) C1-6 alkyl, aryl, halomethyl; R1R2, R1R3, R3R4, R5R6, = (CH2)m; R7 = H, NO2, C1-3 alkyl, halo; R8 = H, halo, Me; R9 = (modified) CO2H; R10 = N-bonded heterocyclyl; Z = O, (substituted) NH; n = 0, 1; m = 3-7] were prepared as bactericides. Benzoylacrylate II was cyclocondensed in a 2-step procedure with 2-aminocyclopentanol to give III [R11 = CO2Et, R12 = H, R13R14 = (CH2)3, R15 = R16 = F]. This was hydrolyzed and treated with piperazine in Me2SO at 140° to give IIII [R11 = CO2H, R12 = H, R13R14 = (CH2)3, R15 = 1-piperazinyl, R16 = F]. IIII [R11 = CO2H, R12 = R13 = Me, R14 = H, R15 = 1-piperazinyl, R16 = F] (IV) had a min. inhibitory concentration of 0.125 mcg/mL against Escherichia coli A261. Tablets were prepared containing IV 583, microcryst. cellulose 55, cornstarch 72, polyvinylpyrrolidone 30, silica 5, and Mg stearate 5 mg.

AB Antibacterial (no data) 1H-pyrido[3,2,1-kl]phenoxazine-2-carboxylates I
 [R1 = H, protective group; R2 = 1 or more H, halo, NO2, amino, cyano, CO2H, OCH2O, R3Y, (un)substituted alkyl; R3 = H, alkyl; W = H, halo; Y = O, S; Z = amino, (un)substituted 4-pyridinyl, saturated heterocyclyl; WZ = OCH2O] were prepared. Thus, 2,3,4,5-F4C6HCO2H was converted to its acid chloride and condensed successively with EtO2CCH2CO2H and (EtO)3CH to give 2,3,4,5-F4C6HCO2C(OEt)2. The latter was aminolyzed by treatment with 2-H2NCH2OH and cyclized by heating with NaH in (MeO)2CH2 to give I (R1 = Et, R2 = H, W = Z = F). This was saponified and condensed with piperazine to give I (R1 = R2 = H, W = F, Z = 1-piperazinyl).

AB Bactericidal (no data) 8H-[1,3]dioxolo[4,5-c]pyrido[3,2,1-kl]phenoxazine-7-carboxylates I (R1 = H, protective group; R2 = H, CO2H, cyano, NO2, amino, halo, O(CH2)2, R32, (un)substituted alkyl; R3 = H, alkyl; Z = O, S; n ≥ 1) were prepared. Thus, 6,7-dibromo-1,3-benzodioxole-5-carbonyl chloride was condensed with HO2CH2CO2Et and the product heated with (EtO)3CH in HOAc at 135° for 1.5 h to give β-oxobenzodioxolepropanoate II (R4 = OEt). The latter was treated with 2-HZNC6H4OH in CH2Cl2 to give II (R4 = 2-HOC6H4NH), which cyclized on refluxing with NaH in (CH2OMe)2 to give I (R1 = Et, R2 = H, n = 1). Saponification of the latter gave I (R1 = R2 = H, n = 1).
